

LAKECITY PROGRESS NEWSLETTER

GENERAL SITE WORK

The LakeCity development continues to move forward at a steady and increasingly visible pace. A section of the project has now been tarred, marking an important milestone in the development of the road network and providing a clear indication of the progress being made on site. Road construction and drainage works remain active across the project, with teams continuing to work on the infrastructure required to improve accessibility, movement, and the long-term functionality of the estate.

Developers have now come to site, adding further activity and professional involvement to the ongoing development. The ZRDC Engineer has also visited the site twice since the last newsletter to conduct inspections and review the progress of the works. These inspections provide an additional level of oversight and help ensure that the various construction activities continue to follow the required standards and development plans.

Overall progress is moving at a faster pace, with several workstreams advancing simultaneously. The site is becoming more organised and visibly cleaner as illegal settlers are increasingly leaving the project area. This change is improving the appearance of the development and allowing construction activities to proceed with greater clarity and efficiency.

SITE OVERVIEW & INFRASTRUCTURE OVERVIEW

TRENCHING

Trenching remains ongoing across all aspects of the project and continues to form a critical part of the infrastructure installation process. The works include trenching for drainage systems, water pipelines, and other essential services that will support the future operation and functionality of the development.

The continuation of trenching has been verified by the Engineer and Warwickshire PVT Ltd, confirming that this workstream remains active and is progressing across the relevant areas of the site.

The trenches are being prepared to accommodate the required infrastructure while allowing for proper alignment, depth, and connection between different sections of the project.

ROADWORKS

As trenching progresses, it is laying the groundwork for the integration of essential services and supporting the next stages of construction.

This work is an important part of ensuring that the development is equipped with reliable, well-planned, and efficient infrastructure as the project advances.

With deliberate care and attention to detail, significant progress is being made in the structured development and tarring of the roadworks, ensuring that the project is carried out efficiently and to the required standards.

Conclusion

The continued progress at LakeCity reflects the commitment of the project team and its development partners.

With road and drainage construction advancing, trenching continuing, inspections taking place, and additional developers now active on site, the project is steadily moving toward its next phase. The improved condition and cleanliness of the site also provide a more positive and clearer view of the development's ongoing transformation.
